
die lines (packaging)

Posted by msilva - 2007/10/11 23:05

For those who may not be familiar with Packaging, there is a term "die line" or "dieline" which I was asked to verify the spelling for someone a while back. It is the term used for creating the correct layout for a packaging item.

My question is: Is it one word or two. It's important because we are preparing documents with this term.

The dictionary does not show it as either. I know it's an industry-specific term so I would like an industry-specific answer, if possible.

I would appreciate any help...

Thanks,
Manny Silva

Good question. I just checked with "The Drafting Zone" website (draftingzone.com) and did not find a reference to your question nor have I any past knowledge of this particular issue. However, as a former checker, I would use two words: die line. This may be an issue that you may want to add to your companies drafting standards to eliminate further confusion.

Best of luck!

I found a quick reference for that term at <http://www.chicagopop.com/solutions.htm> It's spelled as "Die Line". This should help you.

have you thought about contacting the SME? they might be able to clear this up.

Sounds logical to me. Thanks for your time.
Manny

Thanks for checking. That's probably what we'll use in our documents.
Manny

First time I've been on here in a while. But die line (two words) would be correct as the die is part of the tooling used to create the packaging. As in "die-cast" models, etc. .
